Ronit ;

I have used the ApexNRG XFR in numerous (20) cases so far and it is truly a pleasure to work with equipment that is so consistent and accurate. It adds confidence to our work and is a tremendous time saver. We are taking fewer radiographs and getting better results as well. The NRG is quite adept at measuring the constriction, such that the first, early reading has tremendous accuracy, especially when confirmed with the paper point technique.

In comparison with other devices I have used, the NRG is much more reliable.

It is worth reminding dentists that the apical foramen is only rarely at the radiographic root terminus, and thus must resist the instinct to over-instrument, thereby destroying the apical constriction.

So far with the NRG whenever I've encountered an unanticipated "short" reading, I've always had a lateral canal- it's *that* accurate. The small size, quality construction, and distinctive chirp, which makes it possible to work with the NRG without looking at it, are all unexpected bonuses that make the NRG such a satisfying acquisition.
